POD 5 - Generative AI Tools - Exercise

Dr. Noel O'Connor

Ollscoil Chathair
Bhaile Átha Cliath
Dublin City University

00:00:00 - 00:01:06

In this POD you will get a chance to use a Generative AI large language model to see first-hand some of the things it can do. Before you do that please watch the following demonstration looking at two different LLMs at work. There are multiple different options that we can use when it comes to using an LLM. The most popular ones are ChatGPT, Claude, Copilot or Gemini. You can use any of them for free with some restrictions or you can pay a subscription fee to get all of the features such as uploading larger documents and unlimited prompts. For this example we will use ChatGPT as the most famous LLM, as well as Copilot which you have access to through your DCU account. On the screen you will be able to see the same interaction with both LLMs and how they give different responses to the same prompts. In this demonstration, we are going to upload a complex document to both LLMs and then query that document by asking questions of the LLM.

00:01:06 - 00:02:28

We are going to choose a complex document for this purpose. The example I am going to choose is the very complex official rules of the GAA, which is over 74 pages documenting in excruciating detail all of the rules of both hurling and men's football. To upload the document, we first have to find a PDF version of the rules of the GAA online, which you can see [here](#). We download this locally to our computer, as you can see now. And once successfully downloaded, we can then go to both Copilot and ChatGPT. So on the left-hand side, I am searching for Microsoft Copilot and I am clicking on the Copilot interface and on the right-hand side, I am doing the same for ChatGPT. At this point, I can now upload my document to both LLMs. So I upload it by simply dragging it to the interface and you can see on the left-hand side how the LLM is ingesting that document and providing back a summary of what it

has analysed and similarly here for ChatGPT. It should be noted that, in fact, the video here is sped up because often, particularly for complex documents, it can take some time for the LLM to analyse the contents.

00:02:28 - 00:03:15

Now that we have uploaded the document and the LLMs have analysed the document, we can start to ask questions of the LLM by providing so-called prompts. So for example, we can ask the question, how many players on each team? And the LLM will analyse the document and provide a response and you can see that Copilot takes slightly longer than ChatGPT, but ChatGPT comes back quite quickly saying each team consists of 15 players and then even gives a nuanced version of that rule which says that a team may have a smaller number of players at the start of the game as long as they are introduced according to a particular protocol. And we get a very similar response from Copilot, albeit provided in different text. So now let's ask a second question. Let's ask, how do you pass the ball in either of these sports?

00:03:15 - 00:04:32

ChatGPT comes back almost immediately by saying that in Gaelic games, there are two codes, two games called hurling and football and it provides detailed instructions on how the ball may be moved from one player to the next via hand passing, kicking and so on and so forth. And we get a similar response, albeit again, a different response from Copilot, albeit with the same content because they both analyse the same document. As you can see from the responses from both LLMs, they provide quite detailed responses to fairly simple questions. If you're feeling overwhelmed by the amount of detail that is being provided, you can instruct the LLM to provide an answer in a single sentence. So as you can see on the screen, in each case, the previous responses are provided in a more abstract single sentence form that perhaps is more easy to understand, albeit you lose some aspects and nuances of the regulations it's explaining. The next question we're going to ask is who can handle the ball on the ground? We're still in single sentence answer mode, so in each case, each LLM gives us a very succinct answer of who can handle the ball on the ground according to the official rules.

00:04:32 - 00:05:40

The next question is when is a sideline kick awarded? Interestingly, ChatGPT comes back indicating that a sideline kick, which is for football or a puck in hurling, is awarded when the ball crosses the sideline. Copilot comes back with a similar response, but limits itself to only talking about football. The last question we're going to ask is a slightly more complex question and one that very often causes controversy during football or hurling matches. The question is, what if the player is over the line but the ball isn't? In each case, each LLM provides the correct answer, which is that the ball is still considered to be in play and therefore, play continues. At this point, we've had a back and forth and a detailed interaction with each LLM, so perhaps you want to take this information away and you can do so by asking the LLM to provide you with a summary of your conversation.
